SUMMARY

Final-year Computer Science student. I built and published a Flutter mobile game on Google Play, handling signing, closed testing and the store release process end to end. I have built database, REST API, web and mobile layers within a single project, and I am currently developing a second Flutter application with a test-first approach.

TECHNICAL SKILLS

Languages:	Dart, Python, JavaScript, TypeScript, SQL, C
Mobile:	Flutter, Material Design, offline-first application design, internationalization
Testing:	Unit testing, widget testing (Flutter test)
Backend & Data:	Node.js, Express, REST API, layered architecture, SQL Server, embedded JSON data
Release:	Google Play Console, keystore and Android App Bundle signing, closed testing
Tools:	Git, Android Studio, Visual Studio Code, Postman, Figma, FFmpeg
AI:	Google Gemini API, function calling

PROJECTS

Record Draft — Flutter mobile game Google Play · 2026

Google Play: play.google.com/…/com.odekor.recorddraft · Case study: omergunes.vercel.app/record-draft.html

- Built a fully offline football squad-building game; player data and visual assets are embedded in the application package, with no server or account system.
- Designed the core mechanic as a three-dimensional rule engine that evaluates player country, club and league relationships together to compute squad chemistry.
- Focused automated tests on what cannot be caught by eye: rule engines and layout geometry (chemistry calculation, achievement conditions, formation placement, squad persistence).
- Handled keystore generation, App Bundle signing, closed testing and the Google Play release process end to end; processed tester feedback across four release rounds.
- Localized into 10 languages (Turkish, English, German, Spanish, French, Italian, Portuguese, Japanese, Korean, Arabic); managed audio and image assets.

Number 9 — Flutter In development · 2026

- Football career simulation, developed as a closed-source project.
- Test-first workflow: simulation rules are locked as acceptance criteria in tests, with **over 1,800 automated tests** currently passing.
- Design decisions are documented before implementation; formatting, static analysis and the full test suite run at the end of every iteration.

Otuken — Python desktop voice assistant Personal project · 2026

Case study: omergunes.vercel.app/otuken.html

- Built a desktop assistant that processes Turkish voice commands and controls applications on the machine.
- Replaced keyword matching with Gemini function calling: capabilities are exposed to the model as tools, and the model decides which tool to invoke and with which arguments.
- Added a fallback path for every external dependency (quota limits, network failures, audio generation errors) so the assistant never fails silently.
- Created a custom voice character by processing speech output through an FFmpeg filter chain.

EXPERIENCE

Software Engineering Intern — TUNCA GROUP Consulting Two terms · 2026

- Designed relational database schemas including tables, constraints, views and indexes.
- Built a layered REST API with Node.js and Express (route → controller → service → data layer), adding logging middleware and centralized error handling.
- Developed an admin panel interface using React and TypeScript.
- Developed a mobile application with Flutter; produced interface designs in Figma during the second term.

EDUCATION

Karadeniz Technical University — Computer Science Expected graduation: 2027

LANGUAGES

Turkish — native. English — able to read and work with technical documentation; spoken English in progress.
